Using LED lights in your landscape design

LED lights are quickly becoming a standard in landscape design. Not only do they look amazing, but they are inexpensive and easy to install.

THE BENEFITS OF LED LANDSCAPE LIGHTING

- There are no bulbs to replace because LED lights are self contained fixtures.
- Longer lasting than previous styles of lights.
- Lower operating costs due to very low wattage.
- Only require a small, inexpensive transformer to run an entire backyard.
- You can add additional lights to the system at any time without compromising the existing lighting plan.
- All connections are water tight which decreases maintenance in the long run.

To get started, simply call or email us at 905-901-0987 or larry@interfacelandscape.ca

HOW TO DESIGN WITH LANDSCAPE LIGHTS

Spotlights are typically used to up-light specimen trees and garden beds around the perimeter of the property. This provides drama and a unique perspective of depth at night.

Spotlights are used to highlight walkways or steps which provide a safe path through the darkness.

Spotlights can be used to highlight a feature in the garden such as a waterfall or ornamental boulder which adds focal points in the evening.
